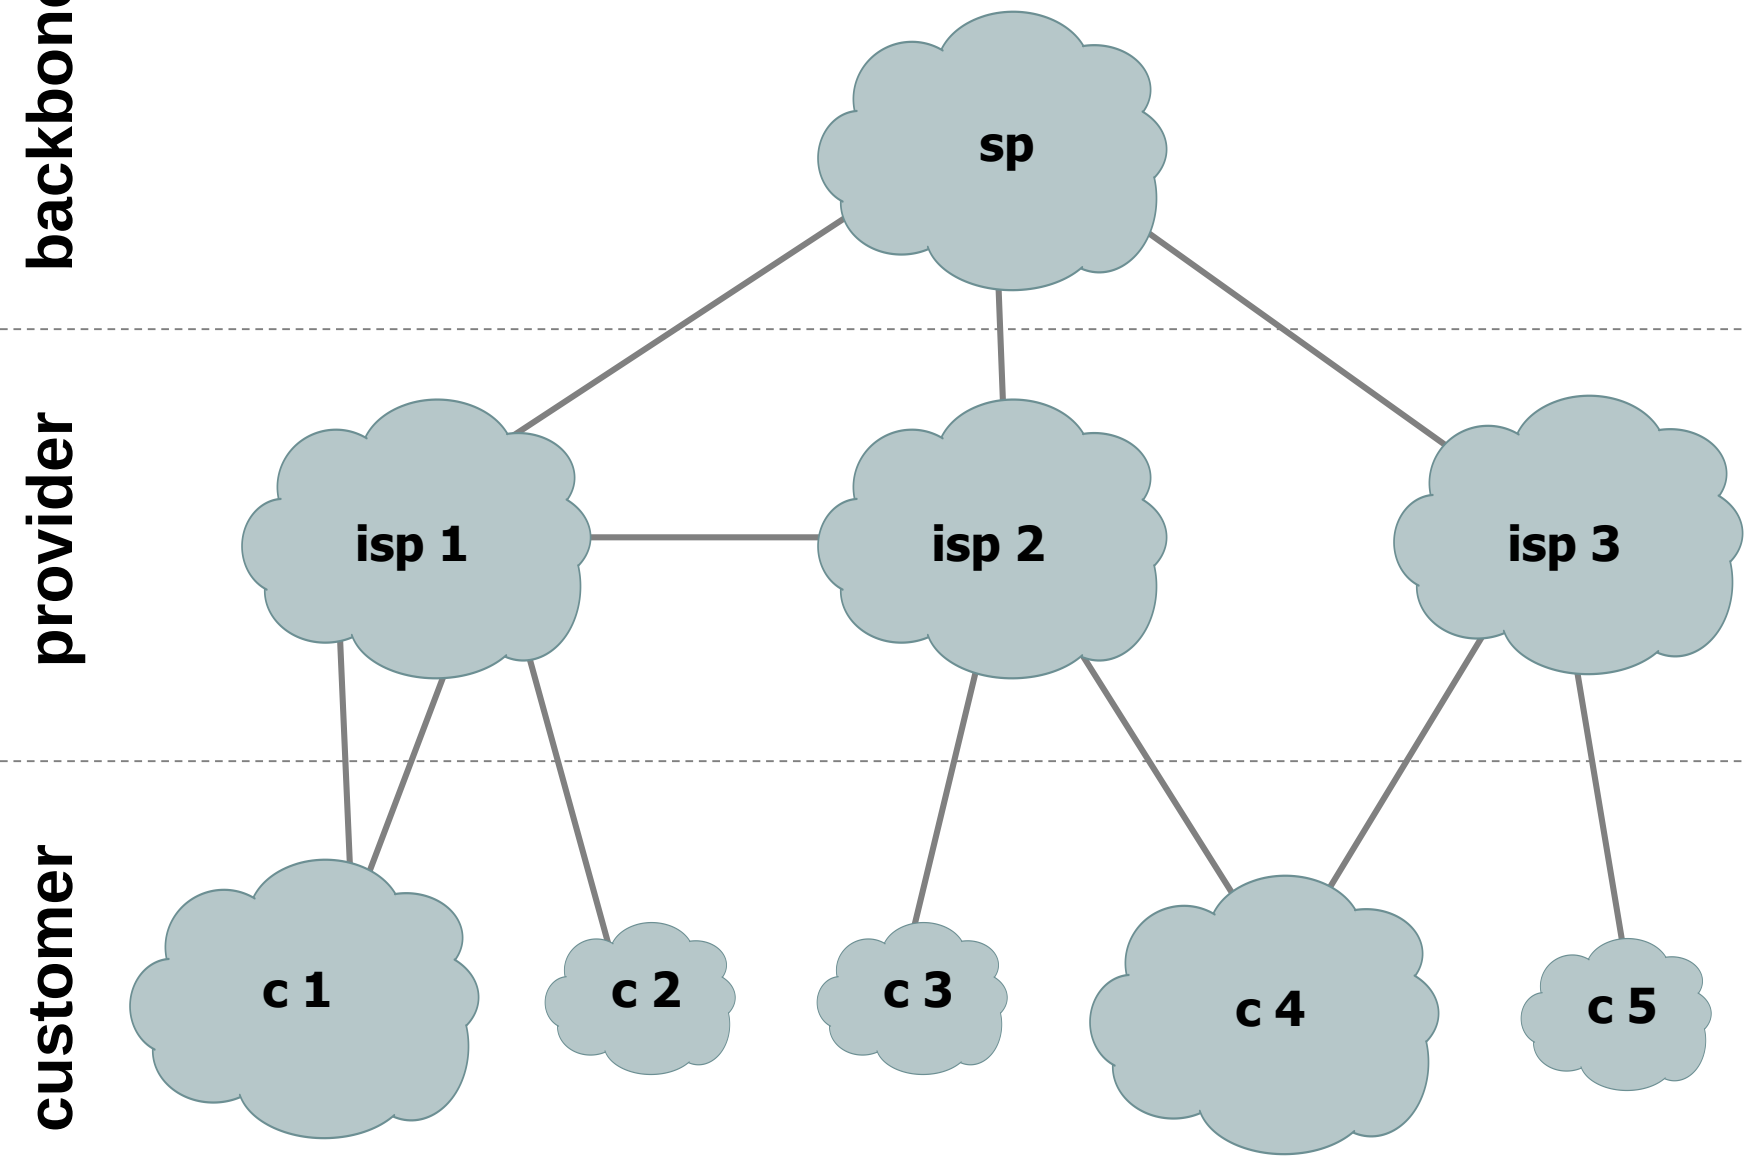
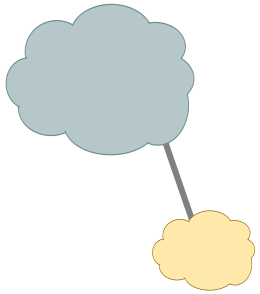
Description	architecture of a stub network; kathara version of a netkit lab

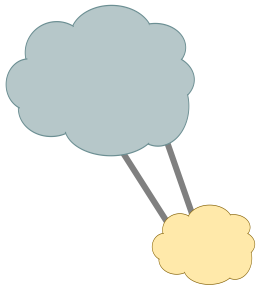
a small internet



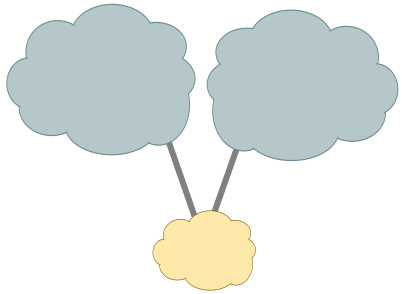
customer classification



- stub networks
  - one link to a single isp

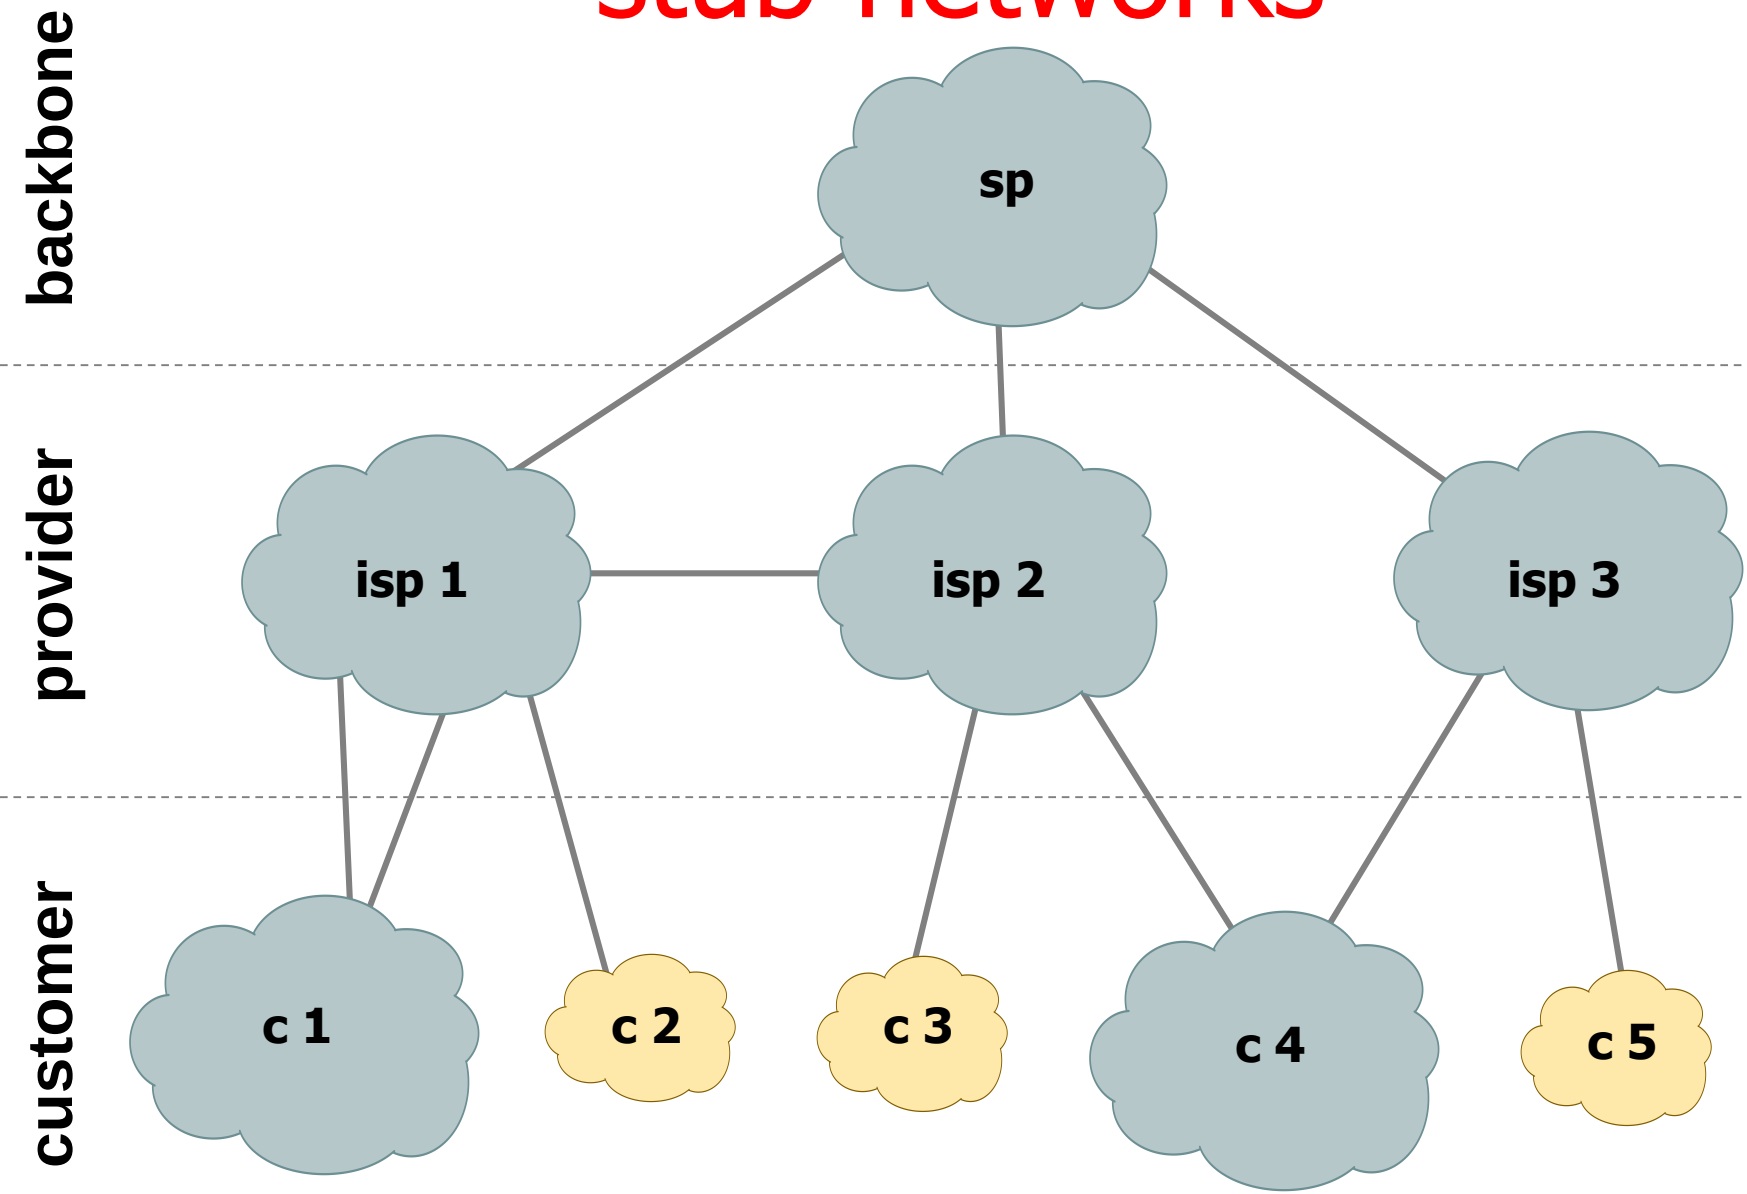


- multi-homed stub network
  - two or more links to the same isp
  - purposes: backup or load sharing

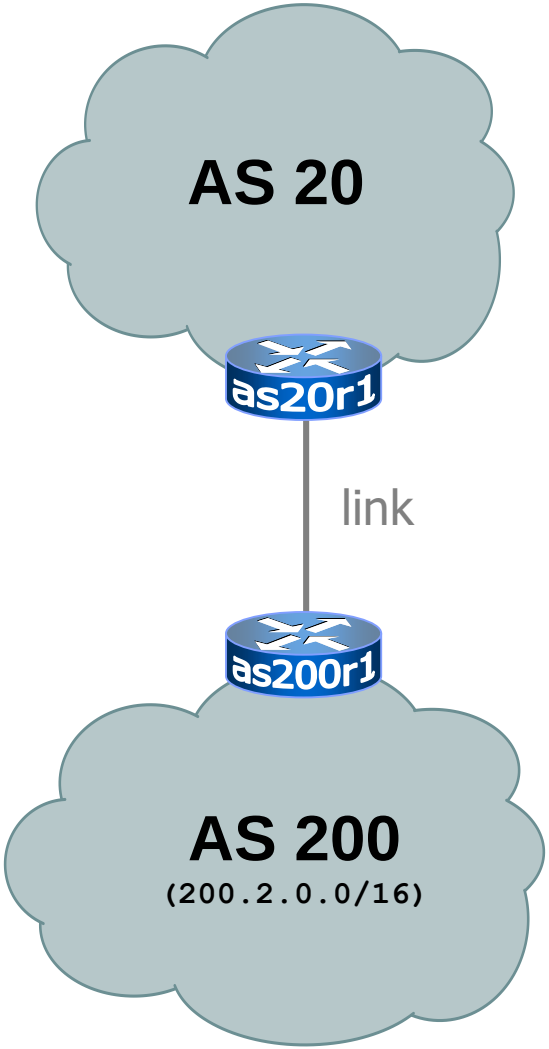


- multi-homed network
  - two or more links to different isps
  - purposes: backup or load sharing

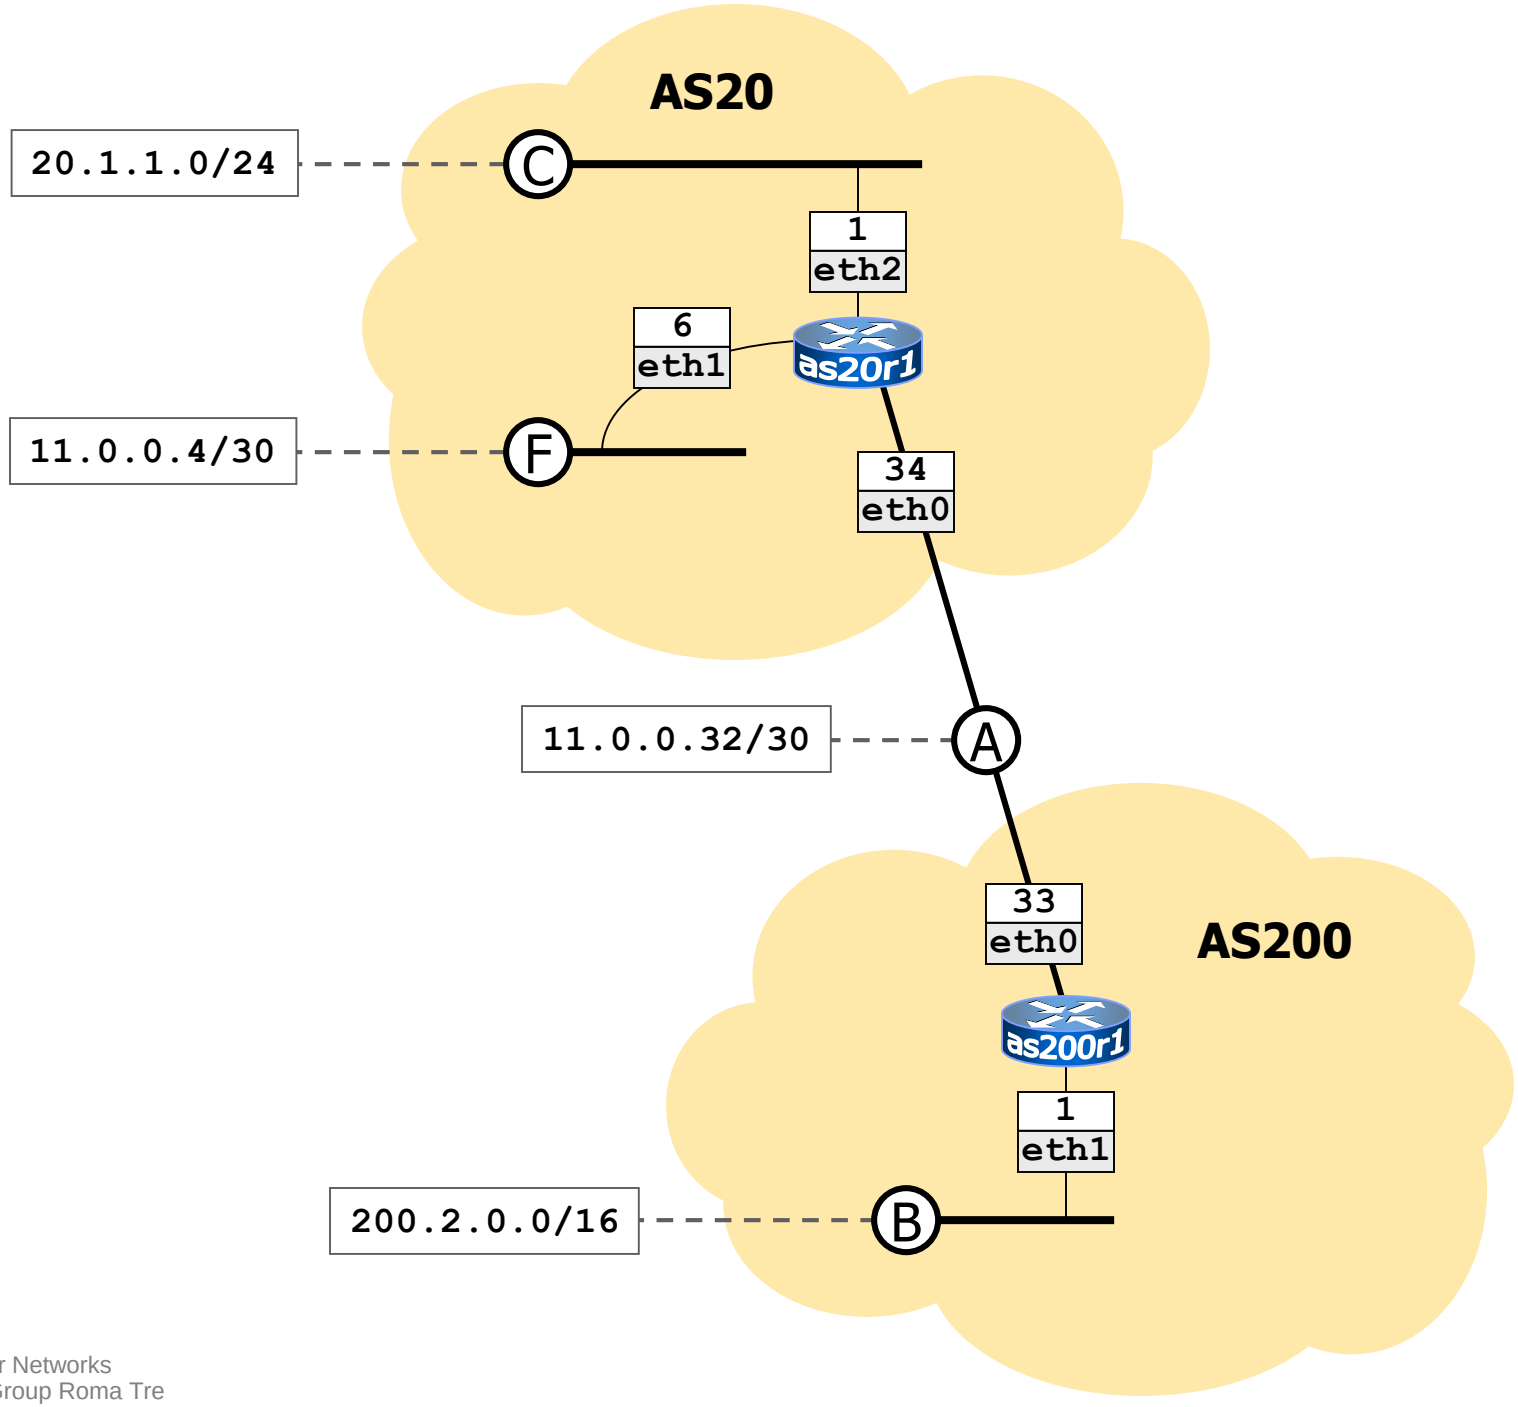
stub networks



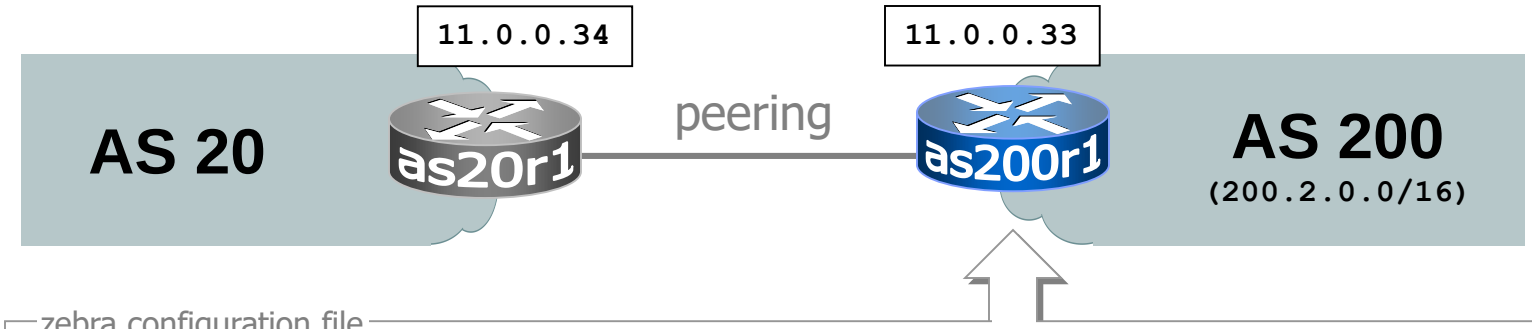
stub network architecture



- one of the customer routers is chosen to be the default gateway
- the router is attached to a single router of the isp with a link (possibly more than one)
- a single peering in which as200 announces its route and accepts the default is enough



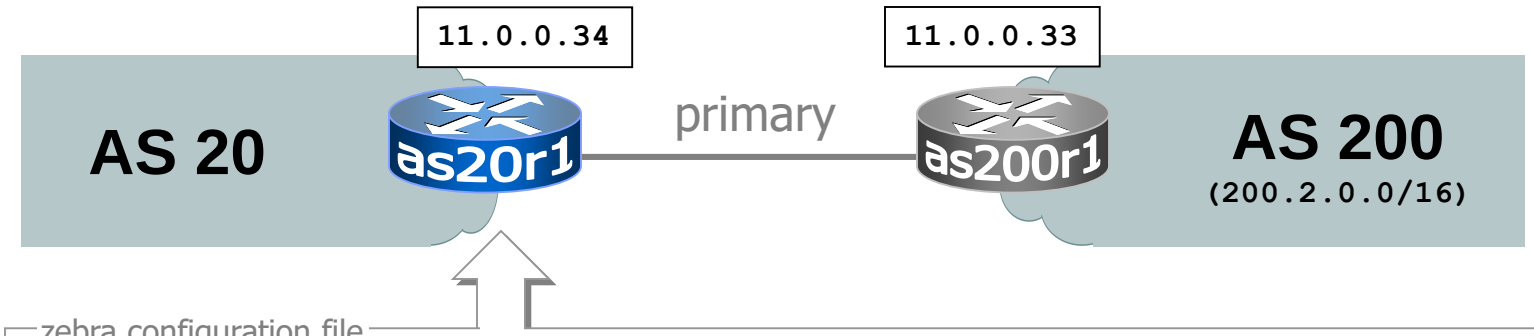
router as200r1 configuration



zebra configuration file

```
! router as200r1 (customer side)
!
router bgp 200
network 200.2.0.0/16
neighbor 11.0.0.34 remote-as 20
neighbor 11.0.0.34 description Router as20r1
```

router as20r1 configuration



zebra configuration file

```
! router as20r1 (isp side)
router bgp 20
network 20.1.1.0/24
network 0.0.0.0/0
neighbor 11.0.0.33 remote-as 200
neighbor 11.0.0.33 description Router as200r1
neighbor 11.0.0.33 default-originate
neighbor 11.0.0.33 prefix-list customerIn in
neighbor 11.0.0.33 prefix-list defaultOut out
!
ip prefix-list customerIn permit 200.2.0.0/16
ip prefix-list defaultOut permit 0.0.0.0/0
```

about `default-originate`

- in zebra, using **`network 0.0.0.0/0`** is enough to
  - place a default route in the local bgp routing table
  - announce it
- using **`default-originate`** for a specific neighbor
  - does not place a default route in the local bgp routing table
  - announces the default route to that neighbor, regardless of the presence of **`network 0.0.0.0/0`** in the local router configuration

about `default-originate`

- **`network 0.0.0.0/0`** may be used at the top of the isp hierarchy to originate the default route
- **`network 0.0.0.0/0`** should **not** be used at intermediate levels of the hierarchy
  - otherwise, routers would prefer the locally originated default route and remove the one offered by their upstream from the forwarding table
- using **`default-originate`** makes the default route appear as if it were originated by the upstream, even if it is not

default-originate and route-maps

- a default route originated with **network** `0.0.0.0/0` is handled like any other route
  - **route-maps** used with a specific neighbor are applied to the default route as well
- a default route originated with **default-originate** is processed by a different **route-map**:

command syntax

neighbor *<neighbor-ip>* **default-originate route-map** *<r-map-name>* **in**

command syntax

neighbor *<neighbor-ip>* **default-originate route-map** *<r-map-name>* **out**

stub as: lab

- start the lab

host machine

```
user@localhost:~$ cd kathara-lab_bgp-stub-as
user@localhost:~/kathara-lab_bgp-stub-as$ lstart
```

- check the bgpd configuration file

as20r1

```
as20r1:~# less /etc/zebra/bgpd.conf
```

- check the bgpd log file

as20r1

```
as20r1:~# less /var/log/zebra/bgpd.log
```

stub as: lab

- check the routing table of as20r1

as20r1

```
as20r1:~# route
Kernel IP routing table
Destination     Gateway         Genmask         Flags Metric Ref    Use Iface
11.0.0.32       *               255.255.255.252 U     0      0        0 eth0
11.0.0.4        *               255.255.255.252 U     0      0        0 eth1
20.1.1.0        *               255.255.255.0   U     0      0        0 eth2
200.2.0.0       11.0.0.33       255.255.0.0     UG    0      0        0 eth0
as20r1:~# telnet localhost zebra
.....
